

Fort George Island Bird Sightings 2007

Updated December 14th

R – These species are either permanent breeding residents (Pileated Woodpecker); or irregular non-breeding residents (Double-crested Cormorant). All are present year round and for the most part are easy to find. Others are common, but heard much more than seen (Clapper Rail). Many species are much easier to find during the breeding season (Yellow-throated Warbler) and some are nocturnal (Black-crowned Night-Heron).

S – These species are the same as those marked with R, EXCEPT they are more sporadic and therefore could be harder to find or even missed (Blue-gray Gnatcatcher).

The dates represent individual sightings and/or the first and last sighting dates. **BOLD** listings were seen in 2006, but not 2007. Have you seen one of these birds? Something different?
